

Experiment – 1.1.2

Student Name: Yatharth Bhaskar

UID: 24IBD70014

Branch: AIT-CSE (Data Science)

Section/Group: 24BDS-4 NTPP (A)

Semester: 5th

Date of Performance: 08 July 2026

Subject: Full Stack-II

Subject Code: 24CSP-337

1. Aim:

To implement a draft management system that allows users to save, retrieve, and manage post drafts within the frontend, with optional simulation of backend interactions.

2. Software Required:

- Node.js & npm
- React.js
- Code Editor (VS Code recommended)
- Browser (Chrome/Edge)

3. Objective:

- To manage draft data using frontend state
- To implement CRUD operations for draft handling
- To understand asynchronous workflows in UI applications

4. Theory:

In the early stages of application development, frontend modules are often developed independently before integrating with backend services. A draft management system enables users to temporarily store and manage content before final publishing, improving flexibility and user experience. This module focuses on implementing draft functionality entirely on the frontend using state management techniques or browser storage mechanisms. Users can create, edit, view, and delete drafts without relying on backend persistence. Additionally, to simulate real-world application behavior, mock API concepts may be introduced .

5. Procedure/Algorithm:

- Create a draft data structure using React state
- Implement functionality to save post content as a draft
- Display a list of saved drafts in the UI
- Enable editing and deletion of drafts
- Handle loading and feedback states for better UX

6. Code:

The screenshot shows a web browser window with the address bar displaying "24bda70257-exp1-fullstack_2". The browser's developer tools are open, showing the "EXPLORER" panel on the left and the "index.html" file selected. The file content is as follows:

```
1 <!doctype html>
2 <html lang="en">
3   <head>
4     <meta charset="UTF-8" />
5     <meta name="viewport" content="width=device-width, initial-scale=1.0" />
6     <title>Post Composer Studio</title>
7   </head>
8   <body>
9     <div id="root"></div>
10    <script type="module" src="/src/main.jsx"></script>
11  </body>
12 </html>
13
```

7. Output:

Post Composer Studio

Build platform-aware posts and manage drafts in one polished workflow.

Multi-platform ready

8. Conclusion:

- Successfully implemented a draft management system using React frontend state.
- Enabled users to create, edit, view, and delete post drafts efficiently.
- Improved user experience through proper state management and responsive UI.
- Demonstrated CRUD operations and optional draft persistence using local
- Storage/mock APIs.
- Gained practical understanding of frontend data handling and asynchronous workflows.

9. Learning Outcomes:

- Learned to manage application state for storing and retrieving drafts.
- Implemented CRUD operations (Create, Read, Update, Delete) for draft management.
- Understood the use of asynchronous workflows and optional mock API integration.
- Learned to use React state management for dynamic frontend applications.
- Enhanced skills in building interactive, modular, and user-friendly React applications.
